

Migration to X# using the Vulcan Runtime

StandardMDI and StandardMDISQL

- Use the Xporter/VO to transport the AEF to a X# application
- Eventually fix the references, if your system does not has the Vulcan DLL in the GAC or if the file sdk_defines.dll is not in the indicated folder
- Fix the compile errors: „error XS9046: Cannot assign to 'font' because it is a 'method'“:
replace „oHL1:Font“ with „oHL1:ControlFont“ in 4 different places. This is enough to make your application compile and run with X#
